Cushion Tire Forklift Attachment

Cushion tires have a smooth profile on a firm tire with its tread being bonded to a steel ring so as to form the tire. The tire is pressed on the hub that is then mounted onto the truck. These types of tires are perfect to use in smooth floor warehouses and are accessible in various polyurethane or rubber compounds.

Consisting of polyurethane, a poly tire is a very solid tire. These kinds of tires are used rather than cushion tires when there is a higher load capacity than can be obtained making use of a cushion tire and such applications that require a lower steering effort. Poly tires available in several hardness ratings so as to meet various individual application requirements. Orderpicker lift trucks and Narrow Aisle models would typically utilize small diameter poly tires for their outrigger load wheels.
