

Independent Fork Positioner

A fork positioner is actually a device made out of high quality materials designed to endure the most difficult operations and work environments. This piece of equipment can enable the one driving to be able to maneuver the blades hydraulically without leaving the seat. Side shifting models have the added ability to be able to laterally position the entire load or the arms in order to facilitate more exact lifting and placement in a faster and much more effective method.

The unique fork pocket design could enable the individual operating it to be able to securely sway the unit's forks without any fear of damaging the positioning cylinders. This allows the worker the choice to either execute independent or simultaneous blade movement, depending on the job requirement. For most lift trucks with non-OEM carriages, complete carriages are required. Standard OEM carriages can be transformed into blade positioners on available units.
